

SkyJet Flight Recovery

Test Credentials & Sample Data · 22North Product Engineering Challenge 2026 — Challenge 1

Everything a reviewer needs to test the app end-to-end. All data is **simulated seed data** — no real passengers, no real payments. Sign-in is **PNR + last name** (both must match).

1. Run it locally

```
cd skyjet-recovery
npm install
npm run dev          # → http://localhost:3000
```

- No environment variables are required. The app ships with an in-memory seeded store, so it works out-of-the-box.
- The RAG chatbot (Disruption Assistant) is optional and falls back to deterministic keyword retrieval when no keys are set. To light up the semantic path, copy `.env.example` → `.env.local` and add `GEMINI_API_KEY` + `PINECONE_API_KEY`.
- Run the tests with `npm test`.

Reset the demo at any time (restores all seed state) — the store also resets on a cold start:

```
curl -X POST http://localhost:3000/api/reset
```

2. Demo login credentials

Log in on the home page (/) with a **PNR** and the passenger's **last name**. Each row is a self-contained test scenario.

#	PNR	Last name	Passenger	Route	Disruption	What you should see
1	SJ7QK2	Sharma	Aarav Sharma (Standard, senior)	DEL → BKK	Cancelled · Weather	Rebook or full refund + meals & hotel. No cash compensation (weather = extraordinary). <i>The primary demo booking.</i>
2	SJ4RM9	Nair	Priya Nair (Silver, +infant)	BOM → SIN	Cancelled · Technical	Rebook/refund + cash compensation (airline-controlled cause).
3	SJ8XP5	Mehta	Rohan Mehta (Gold, Business)	BLR → DXB	Delayed 300 min · Weather	Long-delay: rebook/refund + meals , no compensation.
4	SJ2MN1	Gupta	Ishaan Gupta (Standard)	DEL → BKK	Cancelled · Weather	Unaccompanied minor → must escalate to a human agent (warm handoff).
5	SJ7SR1	Reddy	Kavya Reddy (Silver, senior)	DEL → DXB	Cancelled · Technical	Priority rank 1 — gets a scarce same-day seat.
6	SJ7B22	Singh	Arjun Singh (Gold, Business)	DEL → DXB	Cancelled · Technical	Priority rank 2 — gets the other scarce same-day seat.
7	SJ7IN3	Iyer	Meera Iyer (Standard, +infant)	DEL → DXB	Cancelled · Technical	Priority rank 3 — waitlisted onto the roomy next-day flight.
8	SJ7ST4	Kapoor	Dev Kapoor (Standard)	DEL → DXB	Cancelled · Technical	Priority rank 4 — waitlisted onto the next-day flight.

Fastest path for a reviewer: start with **SJ7QK2 / Sharma** (weather refund story), then **SJ4RM9 / Nair** (compensation story), then **SJ2MN1 / Gupta** (escalation story). Bookings 5–8 together demonstrate priority-based seat allocation when seats are scarce.

3. What each scenario exercises

- **Scenario 1 (DEL→BKK, weather cancel)** — the golden path: identified status card → scored rebooking options → boarding pass, *or* an explainable refund. Alternative flights include a pricier one (pay the difference), a cheaper one (refunded the difference), a full flight (filtered out), and a next-day option.
- **Scenario 2 (BOM→SIN, technical cancel)** — same flow but the cause is airline-controlled, so **cash compensation** applies. Shows the cause-driven eligibility engine.
- **Scenario 3 (BLR→DXB, 300-min weather delay)** — a long *delay* (not a cancel) crossing the meals threshold; Business cabin.
- **Scenario 4 (DEL→DXB, technical cancel, scarce seats)** — four passengers (5–8) compete for **2** same-day seats. Priority order: **senior** → **business** → **infant** → **standard**. The top two are seated same-day; the rest are waitlisted to the roomy next-day flight.

4. Ops / admin panel

The flight-status ops console (`/admin` , and `POST /api/admin/flight`) is guarded by a bearer token.

- **Local/dev token (works out-of-the-box):** `skyjet-ops-2026`
- In **production** the panel stays disabled (503) until you set `ADMIN_TOKEN` in the deployment env.

```
curl http://localhost:3000/api/admin/flights \
-H "Authorization: Bearer skyjet-ops-2026"
```

5. API quick-reference (for scripted testing)

All mutating endpoints are `POST`, JSON in/out. Write endpoints take a client-generated `idempotencyKey`.

```
# Identify & load a booking
curl -X POST http://localhost:3000/api/lookup \
-H 'content-type: application/json' \
-d '{"pnr":"SJ7QK2","lastName":"Sharma"}'

# Request a refund (idempotent)
curl -X POST http://localhost:3000/api/refund \
-H 'content-type: application/json' \
-d '{"ref":"SJ7QK2","idempotencyKey":"<uuid>"}'

# Escalate to a human agent
curl -X POST http://localhost:3000/api/escalate \
-H 'content-type: application/json' \
-d '{"ref":"SJ2MN1"}'

# Impact stats tile
curl http://localhost:3000/api/stats
```

Full endpoint contracts live in `api.md`.

All data here is fictional seed data (`src/Lib/seed.ts`). Refunds and compensation issue a reference number only — there is no payment integration. Reset anytime with `POST /api/reset`.
